Roadmap to shut down NTLM-based applications

Steps	Actions to be taken
STEP #1: Upgrades	• **Move to newer versions** of applications that support Kerberos or modern authentication standards • Check if vendors have dropped NTLM dependencies in recent releases
STEP #2: Replacements	If upgrades (from Step #1) aren't possible, **evaluate replacement options** that align with your identity strategy
STEP #3: Decommissioning	**Build a clear timeline** for retiring applications that depend solely on NTLM
STEP #4: Monitor for clients falling back to NTLM	**Detect cases where NTLM may still be appearing**; common causes can be from IP usage instead of hostnames and improper Kerberos usage
